05 — Database Architecture & Complete Supabase Schema v1.0

Production database blueprint for Supabase PostgreSQL architecture.

1. Database Philosophy

- Multi-tenant architecture: organizations are isolated.
- Supabase PostgreSQL is the core data layer.
- All important actions are logged.
- Sensitive credentials are protected.
- Frontend never directly controls privileged operations.

2. Main Data Flow

3. Core Tables

Table	Purpose
organizations	Company/workspace data
users	Application users
roles	Permission definitions
profiles	User details
activity_logs	Audit history
settings	Configuration
notifications	Alerts

4. Social Module Schema

Tables: social_accounts, social_tokens, social_posts, social_comments, social_messages, sync_logs

5. Content Module Schema

Tables: media_files, content_items, content_versions, content_schedule

6. CRM Module Schema

Tables: clients, client_contacts, client_notes, client_activity, client_tags

7. Email Automation Schema

Tables: email_templates, email_sequences, email_steps, email_logs, email_events

8. AI Agent Data Layer

Tables: ai_tasks, ai_conversations, ai_actions, ai_memory, ai_logs

9. Supabase Security Rules

- Use Row Level Security (RLS).
- Every organization sees only its own records.
- Role permissions control sensitive actions.
- OAuth/API secrets are protected.
- Audit logs record important changes.

10. Production Request Flow

11. Migration Rules

- Schema changes through migrations only.
- Development database tested before production.
- Backups required.
- No uncontrolled production edits.

12. LLM Arena Coding Flow
