

Nibrexo OS AI

09 — Social Media Integration & Publishing Specification v1.0

Production specification for connected social accounts, publishing, scheduling, inbox synchronization, comments, webhooks and platform adapters.

1. Objective

Nibrexo OS AI ka social module connected platforms ko ek centralized control layer mein bring karega. User content ko selected supported platforms par publish/schedule kar sakega aur supported DMs/comments ko unified inbox mein dekh aur manage kar sakega.

2. Supported Platform Strategy

Platform	Primary Use	Integration Rule
TikTok	Short video publishing	Official API/capabilities only
YouTube	Video publishing	Official API/capabilities only
Pinterest	Pins/video content	Official API/capabilities only
LinkedIn	Posts/video/content	Official API/capabilities only
Instagram	Posts/reels where supported	Official API/capabilities only
Facebook	Pages/content	Official API/capabilities only
Contra	Profile/content capabilities if official API supports video content	Verify official APIs before implementation

3. Integration Architecture

4. Account Connection Flow

- Only official authorization/API methods are permitted.
- Requested scopes must be minimal and documented.
- Disconnect must revoke/disable use of the stored connection.
- Expired or invalid authorization moves account to reconnect state.

5. Social Account Data Model

Record	Important Data
Social Account	organization_id, platform, external_account_id, name, status
Credential Reference	account_id, secure credential reference, expiry metadata
Platform Profile	external profile/page/channel identifiers
Sync State	last_sync_at, cursor/checkpoint, status
Capability Map	supported publish/comment/message features

6. Content Publishing Flow

7. Platform Adapter Pattern

- Core publishing logic must not be hard-coded around one platform.
- Each platform gets an isolated adapter/service.
- Adapters expose common operations only where supported.
- Platform-specific features remain explicitly marked.

8. Publishing Status Model

Status	Meaning
DRAFT	Content not ready
VALIDATING	Platform requirements being checked
READY	Passed validation
SCHEDULED	Waiting for scheduled time
PUBLISHING	External API call in progress
PUBLISHED	Confirmed successful
PARTIAL	Some selected platforms succeeded
FAILED	Publishing failed
CANCELLED	User/system cancelled

9. Multi-Platform Publishing Flow

Important: one platform failure must not erase successful results from other platforms.

10. Scheduling Architecture

- Scheduled jobs must be idempotent.
- Timezone must be stored explicitly.
- User can cancel before execution where supported.
- Expired/disconnected accounts should prevent blind execution.

11. Unified Inbox Architecture

- Keep original platform identifiers.
- Preserve sender/recipient context.
- Store timestamps and message status.
- Never merge unrelated threads.

- Unsupported message types remain clearly marked.

12. Comments & Replies

13. Webhook / Sync Strategy

- Use official webhooks where available.
- Verify webhook authenticity/signatures where supported.
- Use scheduled sync as fallback where official capability permits.
- Store sync checkpoints/cursors.
- Process events idempotently.
- Log failed webhook processing for recovery.

14. Platform Capability Matrix

Capability	Rule
Publish	Only if official API supports it
Schedule	Nibrexo scheduler may schedule if platform API supports future publishing or c
DM Read	Only where official permission/API supports it
DM Send	Only where official permission/API supports it
Comments Read	Only where officially available
Comment Reply	Only where officially available
Analytics	Only official metrics/API fields
Delete/Edit	Only when official API permits
Webhook	Use official event system where available

15. Error Handling

16. Duplicate Protection

- Every external publishing request receives an idempotency strategy.
- Retries must not create duplicate posts when avoidable.
- Store external post IDs after successful creation.
- Before retrying, verify whether the external action already succeeded.

17. Security Rules

- Never expose OAuth/API secrets to browser code.
- Use server-side platform adapters.
- Restrict account access by organization and role.
- Store only required scopes.
- Audit connection, publishing and communication actions.

18. LLM Arena Implementation Flow

19. Critical Development Rule

Do not assume that all platforms expose the same API capabilities. The implementation must verify the current official API documentation for each platform before coding a capability. If a platform does not officially support an operation, Nibrexo OS AI must mark that operation as unsupported rather than simulate, scrape or bypass the platform.
